

AI APPLICATION SECURITY

How I Protect AI Banking Support

The model can suggest.
The application decides.

Security decisions stay
in application code.

THE SECURITY CHECK

The model suggests. The app decides.

Every request passes through checks before mock banking data is returned.

Authorization lives in code.

THE FINDING

A prompt changed the account target

Alex asked for help. The model proposed Blair's fictional account.

The bug was in
authorization, not the wording.

THE FIX

The backend stopped trusting the model.

The same request now hits an ownership check before data access.

The model can help.
Code enforces the boundary.
